

Machine intelligence

Be the first to know when machines revolt and seamlessly track & unify them in one log in the meantime

One LabEye to rule them all

Lumi replaces integration with observation and unites all readings from all tech you have in your lab in one log.

Visual intelligence works everywhere software won't, so you don't have to worry about API calls or incompatible devices, anything that's visible is actionable.

It goes above and beyond display or sensor content recognition: handwritten labels are no problem either.

Text recognition:

Reads displays, sensors, monitors and panels of any sort, recognises text, numbers and symbols.

Measurement and timing:

tracks all measurements you do & time stamps all events that happen throughout the experiment.
